The introduction of non-fluoroscopic electroanatomic mapping technologies has enabled electrophysiologists to interpret correctly the gross morphology and attitudinal position of the cardiac chambers during the course of a mapping procedure.¹ Intracardiac echocardiography has also been used to visualise some endocardial structures such as the oval fossa (OF) or terminal crest (TC) and to monitor the effects of ablation.

The coronary sinus drains the great cardiac vein and the middle cardiac vein as well as other small veins . The cardiac veins might be used for catheter ablation of ventricular premature contractions or ventricular tachycardias. Electrophysiologists can reach the epicardium of the left ventricle through the venous system . Small diagnostic and therapeutic (2F–5F) catheters are used inside the coronary veins, and ablation is performed usually with irrigated catheters to avoid

Abstract Cardiac electrophysiologists' use of the coronary sinus (CS) to map and ablate accessory pathways and implant left ventricular leads has emphasized the need for understanding CS anatomy. In this review, we briefly examine the developmental and radiological anatomy of the CS and discuss in detail the gross anatomy of this cardiac vein.
