The humerus (/ ˈ h ɪ u ː m ə r ə s /, plural: humeri) is a long bone in the arm that runs from the shoulder to the elbow.It connects the scapula and the two bones of the lower arm, the radius and ulna, and consists of three sections.The humeral upper extremity consists of a rounded head, a narrow neck, and two short processes (tubercles, sometimes called tuberosities).

Humerus - Wikipedia

The humerus is a long bone of the upper limb, which extends from the shoulder to the elbow. The proximal aspect of the humerus articulates with the glenoid fossa of the scapula, forming the glenohumeral joint. Distally, at the elbow joint, the humerus articulates with the head of the radius and trochlear notch of the ulna.

The humerus is the largest bone of the upper extremity and defines the human brachium (arm). It articulates proximally with the glenoid via the glenohumeral (GH) joint and distally with the radius and ulna at the elbow joint. The most proximal portion of the humerus is the head of the humerus, which forms a ball and socket joint with the glenoid cavity on the scapula.

The head of the humerus is completely protected from above and behind, and the contour in front is formed by the tuberosities. The inner contour on which the thumb naturally comes when the shoulder is grasped is formed by the tip of the coracoid. The forefinger sinks under the edge of the acromion.

The anatomy of the human shoulder | ShoulderDoc

Capsule of shoulder joint (distended). Anterior aspect. In human anatomy, the shoulder joint comprises the part of the body where the humerus attaches to the scapula. The shoulder is the group of structures in the region of the joint. It is made up of three bones: the clavicle (collarbone), the scapula (shoulder blade), and the humerus (upper arm bone) as well as associated muscles, ligaments and tendons.

Shoulder (anatomy) | Psychology Wiki | Fandom

Commonly thought of as a single joint, the shoulder is actually made up of two separate joints - the glenohumeral and acromioclavicular joints. These two joints work together to allow the arm both to circumduct in a large circle and to rotate around its axis at the shoulder. The glenohumeral joint is a ball-and-socket joint formed between the articulation of the rounded head of the humerus (the upper arm bone) and the cup-like depression of the scapula, called the glenoid fossa.

Shoulder Joint - Anatomy Pictures and Information

The socket of the shoulder joint is part of the scapula, and if scapular movement is not normal, then shoulder function cannot be normal. Many people with shoulder pain, weakness, and instability often need to focus on improvements in their scapular function to help improve their shoulder mechanics.
