Lattice Theory. Lattice theory is the study of sets of objects known
as lattices. It is an outgrowth of the study of Boolean algebras, and
provides a framework for unifying the study of classes or ordered
sets in mathematics. The study of lattice theory was given a great
boost by a series of papers and subsequent textbook written by
Birkhoff (1967).

A lattice is an abstract structure studied in the mathematical subdisciplines of order theory and abstract algebra. It consists of a partially ordered set in which every two elements have a unique supremum and a unique infimum. An example is given by the natural numbers, partially ordered by divisibility, for which the

Birkhoff's approach to this development of universal algebra and lattice theory acknowledged prior ideas of Charles Sanders Peirce, Ernst Schröder, and Alfred North Whitehead; in fact, Whitehead had written an 1898 monograph entitled *Universal Algebra*. Further, in 1935, Birkhoff showed that any equivalence between expressions that holds for all possible forms of operator subject to some equational axioms must have a finite proof using certain underlying rules about equality.

Garrett Birkhoff, *Lattice Theory* - PhilPapers It was Garrett Birkhoff's work in the mid-thirties that started the general development of lattice theory. In a brilliant series of papers he demonstrated the importance of lattice theory and showed that it provides a unifying framework for hitherto unrelated developments in many mathematical ...

1) A linearly ordered set (or chain) M where for $a, b \in M$, if $a \leq b$, then. $\sup \{ a, b \} = b, \inf \{ a, b \} = a$.
2) The subspaces of a vector space ordered by inclusion, where. $\sup \{ A, B \} = \{ x : x = a + b, a \in A, b \in B \}$,
 $\inf \{ A, B \} = A \cap B$.
