Computational fluid dynamics (CFD) is a field of fluid mechanics that uses numerical analysis to study and visualize the flow of fluids in real-life. This kind of analysis is included as a part of simulation tool stacks in order to simulate the streaming nature of fluids and the way in which the flow changes when fluids interact with surfaces.

Computational Fluid Dynamics | Fluid Flow Simulation | PTC

Computational fluid dynamics is a branch of fluid mechanics that uses numerical analysis and data structures to analyze and solve problems that involve fluid flows. Computers are used to perform the calculations required to simulate the free-stream flow of the fluid, and the interaction of the fluid with surfaces defined by boundary conditions. With high-speed supercomputers, better solutions can be achieved, and are often required to solve the largest and most complex problems. Ongoing research

COMPUTATIONAL FLUID DYNAMICS

Computational fluid dynamics (CFD) is the use of applied mathematics, physics and computational software to visualize how a gas or liquid flows — as well as how the gas or liquid affects objects as it flows past. Computational fluid dynamics is based on the Navier-Stokes equations. These equations describe how the velocity, pressure, temperature, and density of a moving fluid are related.
