[Dbms Complete Practical Approach By Sharad Maheshwari](#)

What is DBMS? Database Management System (DBMS) is a software for storing and retrieving users' data while considering appropriate security measures. It consists of a group of programs which manipulate the database. The DBMS accepts the request for data from an application and instructs the operating system to provide the specific data.

[What is DBMS? Application, Types, Example, Advantages](#)

A DBMS must guarantee that transactions are executed fully and in- dependently of other transactions. An essential property of a DBMS is that a transaction should execute atomically, or as if it is the only transaction running. Also, transactions will either complete fully, or will be aborted and the database returned to it ' s initial state.
