A web application is based on the server-client model. The client side uses the web browser to access the resources on the server. Web applications are usually accessible over the internet. This makes them vulnerable to attacks.

[How to Hack a Website: Online Example - Guru99](#)

Step 1, Find a vulnerable site where you can post content. A message board is a good example. Remember, if the site is not vulnerable to a cross-site scripting attack, then this will not work.Step 2, Go to create a post. You will need to type some special code into the "post" which will capture the data of all who click on it. You'll want to test to see if the system filters out code. Post `<script>window.alert("test")</script>`If an alert box appears when you click on your post, then the site ...
