A famous simple and intuitively reasonable estimate is Stein's positive part estimate,
$$\hat{\mu}_p = \begin{cases} X - p & |X - p| \geq p \\ 0 & |X - p| < p \end{cases}$$
 where if y is a scalar, $y^+ = \max(y, 0)$. This estimate shrinks $X - p$ towards 0 and if the distance of $X - p$ from 0 is smaller than p declares the estimate to be 0.

Bickel and Doksum is of course a standard text in mathematical statistics. The development of the theory is thorough but not as complete as books by Lehmann or Cassella and Berger. I felt that Bickel and Doksum occasionally left out important theorems and details. Also, the examples given were sometimes unhelpful or irrelevant.
