The precision versus recall plot is given for the full vector space model, latent semantic indexing (i.e., reduced-rank SVD), clustering, nonnegative matrix factorization, and LGK bidiagonalization. The chapter ends by applying all five methods to 30 Medline queries, plotting average precision versus recall.

Normalization is used to scale the data of an attribute so that it falls in a smaller range, such as -1.0 to 1.0 or 0.0 to 1.0.It is generally useful for classification algorithms. Need of Normalization – Normalization is generally required when we are dealing with attributes on a different scale, otherwise, it may lead to a dilution in effectiveness of an important equally important ...
