~~PICAXE is a microcontroller system based on a range of Microchip PIC microcontrollers. PICAXE devices are essentially Microchip PIC devices, with pre-programmed firmware that enables bootloading of code directly from a PC, simplifying hobbyist embedded development (not unlike the Arduino and Parallax BASIC Stamp systems).~~

PICAXE Create is an educational "bolt together" teaching system for learning about electronics. Various input/output modules are simply screwed onto the motherboard, allowing very simple testing and re-configuration of circuits without any soldering.~~

A PICAXE microcontroller is a Microchip PIC microcontroller that has been preprogrammed with the PICAXE bootstrap code. The bootstrap code enables the microcontroller to be reprogrammed without the need for an (expensive) conventional programmer, making the whole download system a very low-cost simple serial cable!

The smallest, but most popular, PICAXE microcontroller. Very popular in education due to its low cost and small size, but also very popular in a wide range of hobbyist projects. Small but perfectly formed! This chip supports up to 6 inputs/outputs with 3 analogue/touch sensor channels.

pic6 shows one of the smallest complete microcontroller modules you can make. It contains two resistors at Serin and its input pin to keep them from floating. It also has a resistor and surface mount LED to show when it has power. Instead of dead bug style where the components are soldered underneath the IC, here they are soldered on top.

i2c and PICAXE. The i2c (inter-integrated circuit) protocol is a widely implemented method for moving data back and forth among integrated circuits. All of the X, X1 and X2 PICAXE parts support the i2c protocol. In i2c a potentially large number of devices are all connected via a simple two-wire serial bus.

The CD40106B is a HEX inverter circuit using only 2 of the six available inverters. The CD40106B +Vcc is connected to +12-volts (pin 16) and ground (pin 8) are not shown. The four unused inputs should go to ground. The CD40106B has Schmitt trigger inputs. A LOW output from the PICAXE is inverted to HIGH on the MOSFET gate turning on the MOSFET.

The PICAXE gets around most of those problems. The PICAXE uses a form of basic similar to the Parallax series of micro-controllers at a cost of \$6-\$7 versus \$40-\$50 for the Basic Stamp series. PICAXE basic is free while PicBasic Pro and others cost hundreds of dollars.
