Abstract. Numerical simulations of the sediment-air-water buoyant jet released through the hopper dredgers overflow shaft have been performed. The release of sediments into the marine environment due to skimming the excess water from the dredging vessel's hopper can lead to increased turbidity and adverse effects on the adjacent environment. Base-case simulations have been validated using in situ field observations.

ABSTRACT. A numerical simulation method based on the Ffowcs-Williams and Hawkins model is employed to predict the mechanisms of the near-field aerodynamic noise distribution characteristics of an adjustable-blade axial-flow fan with different installation angles of moving blades (θ). The simulated results reveal that with θ changing from 0° to 12° , the changing curves of the maximum total sound pressure level (MTSPL) at the tip clearance region (A region), the leading edge ...
