Abstract. A pericyclic reaction is a reaction in which bonds are formed or broken at the termini of one or more conjugated π systems. The electrons move around in a circle, all bonds are made and broken simultaneously, and no intermediates intervene. The requirement of concertedness distinguishes pericyclic reactions from most polar or free-radical reactions, although for many pericyclic reactions reasonable alternative stepwise mechanisms can also be drawn.

Under the generic name pericyclic reactions is hidden the whole class of processes, the typical feature of which is that their mechanisms can be simply visualized by a cyclic exchange of bonds. Pericyclic Reactions | SpringerLink

Abstract. According to Woodward and Hoffmann ([1] p. 182), the pericyclic reactions comprise all concerted intermolecular and intramolecular (electrocyclic, sigmatropic) cycloaddition reactions. The rules of selection of preferable structures for transition states of these reactions based on the principles of orbital approach have found wide acceptance and may serve as an example of an effective qualitative theory.

Pericyclic Reactions - Springer
Pericyclic reactions are mainly of four classes: electrocyclic, cycloaddition, sigmatropic rearrangement and group transfer reactions. These reactions are highly regio- and stereoselective and provide stereospecific products in more than 90 % yields in most cases.

General Aspects of Pericyclic Reactions | SpringerLink
Pericyclic Reactions in the Chemistry of Heterocycles. Pericyclic reactions are characterized with cyclic transition states, resulting in high regio- and stereoselectivity, thus are widely used as synthetic tools for the construction of complex molecular frameworks of natural products and for the preparation of heterocyclic compounds containing aromatic, as well as non-aromatic rings.

This book provides a concise introduction to pericyclic and photochemical reactions for organic synthesis. In the first part about pericyclic reactions, the author explains electrocyclic reactions, cycloaddition reactions, sigmatropic rearrangements, and group transfer reactions. The second part on photochemistry is dedicated to photochemical reactions of a variety of compound classes, including alkenes, dienes, and polyenes, carbonyl compounds, and aromatic compounds.

Pericyclic Reactions Springer - guitar-academy.co.za
In organic chemistry, a pericyclic reaction is the type of organic reaction wherein the transition state of the molecule has a cyclic geometry, the reaction progresses in a concerted fashion, and the bond orbitals involved in the reaction overlap in a continuous cycle at the transition state. Pericyclic reactions stand in contrast to linear reactions, encompassing most organic transformations and proceeding through an acyclic transition state, on the one hand and coarctate reactions, which ...

Pericyclic reaction - Wikipedia
Pericyclic reactions constitute a fundamental class of organic chemistry, including such commercially important synthetic reactions as theDiels-Alder reaction. This primer gives a concise and accessible account of these reactions, enabling students to recognise the different types of pericyclic reaction and understand their application in organic synthesis.
