A component-based software paradigm can be used effectively in the design of embedded real-time systems to provide advantages such as software reuse, improved maintainability, reconfiguring software on the fly, and ability to easily fine-tune a real-time application's timing properties.

Software Components for Real Time - Embedded.com
A real-time computer system may be a component of a larger system in which it is embedded; reasonably, such a computer component is called an embedded system. Applications and examples of real-time systems are ubiquitous and proliferating, appearing as part of our commercial, government, military, medical, educational, and cultural infrastructures.

What Are Real-Time Embedded Systems
Components of Embedded System. An Embedded System consists of four main components. They are the Processor (Microprocessor or Microcontroller), Memory (RAM and ROM), Peripherals (Input and Output) and Software (main program). Processor: The heart of an Embedded System is the Processor.
