associated with AL after small intestinal and colonic anastomoses through a multivariate analysis.

~~Predictive Factors for Small Intestinal and Colonic ...~~

Most preoperative risk factors are not modifiable, but adjustable risk factors include smoking, obesity, alcohol, and medications such as immunosuppressants and chemotherapy.²

Intraoperative risk factors include operative techniques. Kingham and Pachter² compared sutured anastomoses versus stapled anastomoses.

The risk of leakage is higher in people who are obese or on steroids. Smoking and excessive drinking can also increase the risk of anastomotic leakage.

~~Anastomosis: Definition, Techniques, Types, and Risks~~

Careful history taking may elicit important risk factors for anastomotic leakage (e.g. a history of smoking or alcohol abuse), which may not otherwise be evident, and about which some patients may be reticent.

The authors' multivariate regression analysis showed the following independent risk factors for major anastomotic leak: male sex ($P = 0.014$, odds ratio [OR]: 2.9), arterial hypertension ($P = 0.048$, OR: 2.29), and perioperative transfusion ($P < 0.001$, OR: 2.4 per liter). In this study, the overall 60-day complication rate in that study was 27.3%.

Anastomotic Leakage after~~

~~...~~

The multivariate risk factor analysis showed BMI, time of operation and prophylactic drainage to be major factors, independently associated with anastomotic leakage. A BMI higher than 30, which is considered obese according to the Centers of Disease Control and Prevention (CDC) [33], increased the risk for developing leakage almost three-fold.
