1.6. Discrete Random Variables 2 Definition 1.6.2. Let X be a discrete random variable with space D . The probability mass function of X is $p_X(x) = P(X = x)$ for $x \in D$. The support of discrete random variable X , denoted S , is the set of points in the space (range) of X which has positive probability: $S = \{x \in D \mid p_X(x) = P(X = x) > 0\}$. Note.

The variance of a discrete random variable is given by the formula where x is the value of the random variable and $P(x)$ is the probability of observing the random variable x . To find the standard deviation of the discrete random variable, take the square root of the variance. We'll just do one quick example of standard deviation.

The probabilities behave well in that (1) the probabilities are all greater than 0, that is, $P(X = x) > 0$ and (2) the probability of the sample space is 1, that is, $P(S) = P(X = 0) + P(X = 1) + P(X = 2) + P(X = 3) = 1$. Because the values that it takes on are random, the variable X has a special name. It is called a random variable!
